

When you multiply a fraction by a fraction, you are taking something small and breaking it into even smaller parts. You can expect the answer to be smaller than either of the fractions you started with.

Hide

Multiply $\frac{3}{4}$ by $\frac{1}{3}$. Look for ways to cancel (or factor out) a multiple common to the numerator and the denominator. This makes the problem simpler.

Step 2

$$\frac{1}{4} \times \frac{1}{1}$$

Multiply across using the new numerators and denominators.

$$\frac{1}{4} \times \frac{1}{1} = \frac{1}{4} \text{ pound}$$

Hide

Step 1

$$\frac{6}{7} \times \frac{7}{9} = \frac{42}{63} \div \frac{21}{21} = \frac{2}{3}$$

Cancel the numerator of the first fraction and the denominator of the second fraction.

$$\frac{\cancel{2}^2}{7} \times \frac{7}{\cancel{9}_3}$$

Step 3

$$\frac{\overset{2}{\cancel{6}}}{\underset{1}{\cancel{7}}} \times \frac{\overset{7}{\cancel{1}}}{\underset{\cancel{9}}{3}}$$

Step 4

$$\frac{2}{1} \times \frac{1}{3} = \frac{2}{3}$$
