Time and Temperature

You are already familiar with most units of **time**. You can make conversions with units of time using the same methods you use with other units. The most common units of time are shown in the table.

When you work with time, sometimes you will get an answer with a decimal. That decimal represents a part of a larger unit.

Unit	Equivalencies
second (s or sec)	$1\text{ s} = \frac{1}{60}\text{ min}$
minute (min)	$1\text{ min} = 60\text{ s}$
hour (hr)	$1\text{ hr} = 60\text{ min}$
day (d)	$1\text{ d} = 24\text{ hr}$
week (wk)	$1\text{ wk} = 7\text{ d}$
month (mo)	$1\text{ mo} = \frac{1}{12}\text{ yr}$
year (yr)	$1\text{ yr} = 12\text{ mo}$ $1\text{ yr} = 365\text{ d}$

Lesson 1: Customary Units of Measurement

Related Questions:

[Practice questions taken related to this topic](#)

Example 1

Hide

From 1:30 p.m. to 7:30 p.m., Olivia can meet with 4 clients. If she sees each client for an equal amount of time, how long does each meeting take? Express your answer in hours and minutes.

Step 1

Subtract.

$$\begin{array}{r} 7:30 \\ -1:30 \\ \hline 6:00 = 6\text{ hr } 0\text{ min} \end{array}$$

Divide

$$6 \div 4 = 1.5\text{ hours}$$

Step 2

Change to hours and minutes.

The 1 represents 1 whole hour.

The .5 represents a part of an hour.

$$1\text{ hour} = 60\text{ minutes}$$

$$.5 \times 60 = 30\text{ minutes}$$

Tip

Hide

Be careful when calculating time with a calculator! 3.25 hours equals 3 hours 15 minutes, not 3 hours 25 minutes. Your knowledge of fractions can also help you make the conversion. You know that .25 is equal to $\frac{1}{4}$. What is $\frac{1}{4}$ of 1 hour? 15 minutes

Olivia meets with each client for **1 hour and 30 minutes**.

Temperature measures the hotness or coldness of an object or environment. The two most common scales for measuring temperature are Fahrenheit (°F) and Celsius (°C). Fahrenheit is commonly used in the U.S. Celsius is used in many places that use the metric system.

When you work with temperature, you will often have to decide whether a temperature is increasing or decreasing. An increase in temperature is sometimes written with a + sign, and a decrease is sometimes written with a – sign.

+5° means an increase of 5 degrees –5° means a decrease of 5 degrees

Example 2

Hide

The normal temperature for the human body is 98.6°F. Kyle has a temperature of 101.4°F. How many degrees higher than normal is Kyle’s temperature?

Use subtraction to find the difference between two temperatures.

$$101.4^{\circ} - 98.6^{\circ} = 2.8^{\circ}$$

Kyle’s temperature is **2.8°F higher** than normal, or +2.8°.
