

# Circle Graphs

A **circle graph** displays data as sections of a circle. Circle graphs are especially useful to show how a whole amount, such as a budget, is made up of several parts.

In a circle graph, the circle represents the whole amount. Each segment represents a part of the whole. Larger segments represent greater parts of the whole. Data in a circle graph can be displayed as a percent, a fraction, or a decimal. The whole circle can equal 100%, 1, or \$1.00.

## Example

Hide

How many students are enrolled as juniors at Grandview Community College?

$$\begin{aligned}\text{number of juniors} &= (15\%)(11400) \\ &= (0.15)(11400) \\ &= 1710\end{aligned}$$

Find the section of the graph labeled “Juniors.” It shows that 15% of Grandview’s students are enrolled as juniors.

Locate the total enrollment on the graph. Grandview has a total of 11,400 students enrolled during the fall.

15% of 11,400 is 1,710.

**1,710 students** are enrolled as juniors.
