

Division and multiplication are opposite operations. This important fact allows you to change division into multiplication.

## Category

### Lesson 5: Operations with Fractions

Hide

Invert the divisor (the number you are dividing *by*).

$$\frac{1}{2} \div \frac{1}{4} = \frac{1}{4} \text{ inverts to } \frac{4}{1}$$

Change  $\div$  into  $\times$ . Use canceling, if possible.

$$\frac{1}{\cancel{1}2} \times \frac{\cancel{4}^2}{1}$$

Multiply across using the new numerators and denominators.

$$\frac{1}{1} \times \frac{2}{1} = 2$$

Angela can give her cat  $\frac{1}{4}$  of a pill **2 more times**.

Hide

Write the whole number as a fraction with a denominator of 1. Then invert the fraction.

$$\frac{3}{4} \div \frac{6}{1} \qquad \frac{6}{1} \text{ inverts to } \frac{1}{6}$$

Change  $\div$  into  $\times$ . Use canceling, if possible.

$$\frac{\cancel{1}3}{4} \times \frac{1}{\cancel{6}2}$$

Multiply across using the new numerators and denominators.

$$\frac{1}{4} \times \frac{1}{2} = \frac{1}{8}$$

Each person will get  $\frac{1}{8}$  of the pie.
