Using Graphs of Systems to Solve Problems

Graphs are often used to help businesses and individuals make important decisions. They can be used to find the best economic strategies and to optimize profits.

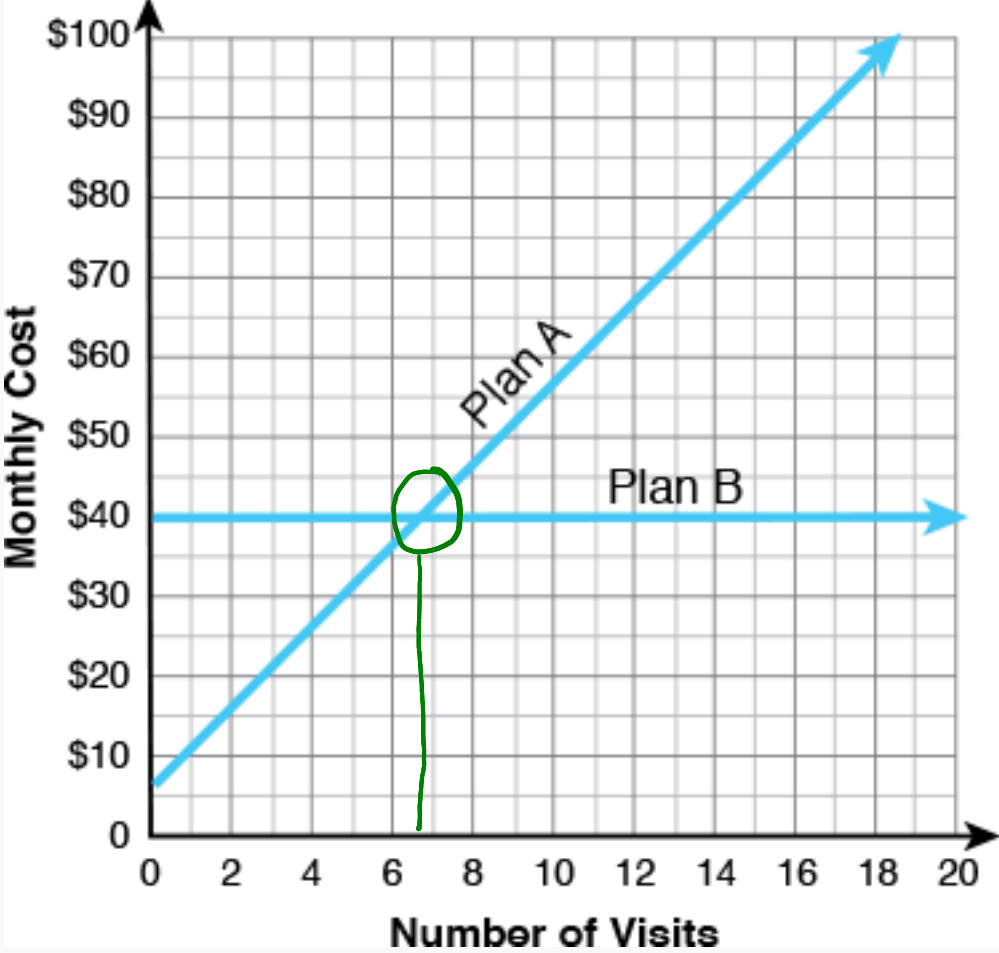

Example

Hide

A swim club offers two membership options. Plan A charges \$8 per month and \$5 per visit. Plan B charges \$40 per month for unlimited use of the club. The graph shows both plans.

Plan B becomes the better deal after how many visits?

The lines intersect between 6 and 7 visits. If a member uses the club 6 or fewer times per month, Plan A is best. If a member visits **7 or more times per month**, Plan B is best.
