Lesson 4: Rational Expressions

Related Questions: [Practice questions taken related to this topic](#)

Dividing Rational Expressions

You know that division is the opposite of multiplication. When you divide fractions, you invert the fraction you are dividing by and then multiply.

Example 1

Hide

Divide: $\frac{7}{12} \div \frac{5}{6}$

Step 1
Change to multiplication and invert the divisor.

$$\frac{7}{12} \div \frac{5}{6} = \frac{7}{12} \times \frac{6}{5}$$

Step 2
Cancel and multiply.

$$\frac{7}{\cancel{12}_2} \times \frac{\overset{1}{\cancel{6}}}{5} = \frac{7}{10}$$

Dividing rational expressions works the same way. Change to multiplication and invert the second expression.

Example 2

Hide

Divide: $\frac{m^3n}{20n} \div \frac{2mn}{15mn^3}$

Step 1
Change to multiplication and invert the divisor.

$$\frac{m^3n}{20n} \div \frac{2mn}{15mn^3} = \frac{m^3n}{20n} \bullet \frac{15mn^3}{2mn}$$

Step 2
Cancel.

$$\frac{m^3 \cancel{n}}{\cancel{20n}_4} \bullet \frac{\overset{3n^2}{\cancel{15mn^3}}}{\cancel{2mn}}$$

Step 3
Multiply straight across.

$$\frac{m^3 \cancel{n}}{\cancel{20n}_4} \bullet \frac{\overset{3n^2}{\cancel{15mn^3}}}{\cancel{2mn}} = \frac{3m^3n^2}{8}$$

Remember to factor each numerator and denominator before canceling. You can cancel identical factors only.

Example 3

Hide

Divide: $\frac{x^2-8x}{x^2+8x+16} \div \frac{x-8}{x^2-2x-24}$

Step 1
Change to multiplication and invert the divisor.

$$\frac{x^2-8x}{x^2+8x+16} \bullet \frac{x^2-2x-24}{x-8}$$

Step 2
Factor.

$$\frac{x(x-8)}{(x+4)(x+4)} \bullet \frac{(x+4)(x-6)}{x-8}$$

Step 3
Cancel.

$$\frac{x \cancel{(x-8)}}{(x+4) \cancel{(x+4)}} \bullet \frac{\cancel{(x+4)} (x-6)}{\cancel{x-8}}$$

Step 4
Multiply across.

$$\frac{x \cancel{(x-8)}}{(x+4) \cancel{(x+4)}} \bullet \frac{\cancel{(x+4)} (x-6)}{\cancel{x-8}}$$
$$= \frac{x(x-6)}{(x+4)}$$
$$= \frac{x^2-6x}{x+4}$$
