Percent

A **percent** represents the number of parts out of 100 parts.

In the box shown here, 40 of the 100 squares are shaded. Therefore, 40% of the squares are shaded and 60% are unshaded.

$100\% = \frac{100}{100} = 1$

If all of the squares were shaded, then 100% would be shaded.

100% represents the *whole amount*. (100% = 1)

Percents can be added or subtracted as long as they represent parts of the same whole.

Example 1

Hide

If 40 of the 100 squares are shaded, then what percent of the squares are unshaded?

You can figure the percent of unshaded squares by subtracting the percent of shaded squares (40%) from 100%.

100% − 40% = **60%**

Example 2

Hide

If 40 of the 100 squares are shaded, and you shade 10 more, what percent of the squares will be shaded?

If 40% of the squares are shaded and you shade 10 more, then you have shaded another 10% of the squares.

Add the percents together to find the total percent shaded.

40% + 10% = **50%**

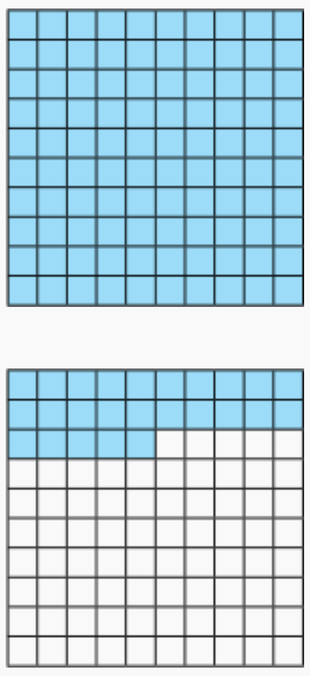

Example 3

Hide

Since 100% stands for the whole amount, a percent less than 100% represents a part of the whole amount. A percent more than 100% represents more than the whole.

How much does 125% represent?

You can rewrite 125% as 100% + 25%. Since 100% is the same as the whole amount, 125% represents the **whole amount plus 25% more.**
